

The map shows the location of the Commonwealth of The Bahamas in the Caribbean Sea, consisting of numerous islands and cays. Key locations labeled include West End, Freeport, Grand Bahama I., Little Abaco, Abaco I., Marsh Harbour, Hope Town, Bimini Is., Berry Is., Spanish Wells, Current, Governor's, and various passes like Northwest Channel, Northeast Providence Channel, and Mayaguana Passage.

The coat of arms of The Bahamas features a central shield depicting a sun rising over a sea turtle, flanked by two flamingos. Above the shield is a crest with a palm tree and a fish. A scroll at the bottom bears the motto "FORWARD, UPWARD, ONWARD, TOGETHER".

A large, diverse group of people of various ages and ethnicities are posed together in a studio setting, symbolizing the multi-cultural nature of the population.

THE COMMONWEALTH OF THE BAHAMAS

Population Projections 2010 - 2040

**Department of Statistics
Ministry of Finance
P.O. Box N-3904**

Preface

Population projections are one of the most important tools used in demographic analysis. Policy makers and planners, both in Government and private sector, find projections useful as they provide detailed information on the future size and structure of the population of a country. This information forms the basis of a consistent framework within which planners can set proposals and policymakers can make decisions. There are a number of ways in which population projections can be used as an effective tool for planning. Some of them are:-

- (i) Estimating future school-age population and its attributes.
- (ii) Estimating the future size of the labour force and therefore the demand for the creation of new jobs.
- (iii) Estimating future housing requirements.
- (iv) Estimating future health services requirements.

Population projections can enhance planning for the future by indicating the likely outcomes of current trends. The future is not the inevitable outcome of predetermined trends; however, it can be altered in many ways. If the likely outcomes of the observed trends are perceived to be undesirable, plans can be implemented to ensure that such outcomes will not be realized. In such an instance the role of planning is to make sure that a particular projection never comes true.

Population projections for The Bahamas have been produced by the Department of Statistics since 1970. The method used projects into the future, the size, age and sex structure of the population, based on assumptions about the future birth and death rates, and levels of international migration. The process uses a “component method” which analyses past trends of each component of population change; births, deaths and migration.

A total of nine sets of projections were produced based on a low, medium and high assumption for each of the components except mortality, where two assumptions were used. Only three series representing high, medium and low variant are presented in this report.

Kelsie Dorsett

METHODOLOGY

The software package used for producing this series of projections was DemProj Version 4.1. Demproj is produced by the United States Agency for International Development (USAID).

Demproj uses the “cohort component method” modified to produce a single year projection and projected population by single ages.

The component method, involves the separate projection, based on explicit assumptions of fertility, mortality and migration. These assumptions are applied to the base year population. These methods give considerable insight into the way the population will change because of the explicit assumptions used.

This method involves four (4) components:-

1. Base Year Population

The 2010 census population by 5 year age-groups and sex was used as the base year population. The official population of 351,461 will be rounded to 351,500 by the programme. This figure of 351,500 will be used when analyzing the projection results.

2. Fertility Component

The projection of the fertility component was done in two stages. Firstly, the base year total fertility (TFR) was either held constant or interpolated for each single year of the projection period. Secondly, the age specific fertility rates (ASFR'S) for the current year/period were applied to the projected TFR'S. The programme automatically calculated the Gross Reproduction Rates (GRR) and the Net Reproduction Rates (NRR). The sex ratio at birth was provided by the programme.

3. Mortality Component

In projecting mortality, life expectancy at birth for males and females were projected by single years using the 2009-2011 Life Tables for The Bahamas as the base for each projection period. The base year life expectancy was interpolated to the end of the projection

period. The programme uses a linear form of interpolation so that the difference between each annual value is the same.

The programme automatically calculated the underlying survivorship ratios based on the choice of model life table. The Coale and Demeny's West model life table was selected for these projections. In selecting a model life table it was assumed that male and female survival ratios from the country's life tables will gradually reach the survival ratios of the selected model life table as life expectancy reaches its maximum value in the model life table.

3. Migration Component

Based on the level of migration during 2000-2010, the number of net migrants by five year age-groups and sex was projected for each year of the projection period. The projected age and sex distribution assumed the same pattern of the migrants for the period 2000-2010.

DEMOGRAPHIC ASSUMPTIONS

Three series of projections (High, Medium and Low) were produced based on a combination of multiple assumptions concerning all components of population change. Usually one of the series is designated as 'most probable' in that it includes the assumptions that are most likely to occur. In this instance the 'medium' series has been designated as the 'most probable' series.

FERTILITY

Three assumptions were made concerning fertility:-

- (1) **High Assumption (A)** - It was assumed that the total fertility rate of 1.80 per woman in the base year, will increase to 2.15 by the year 2015 and remain constant until the year 2040. This assumption was based on the fact that the 2000 Census revealed that 54.5% of the female population was still in the childbearing years (15-49) and likely to bear a child/children.

- (2) **Medium Assumption (B)** - It was assumed that the total fertility rate of 1.80 per woman will gradually increase to 2.01 in 2020 and remain constant to the year 2030, thereafter declining to 2.0 for the remainder of the projection period. This assumption is based on the fact that fertility decreases as the level of education of women increases as revealed in both the 2000 and 2010 censuses. This was further evidenced in the declining annual net reproduction rates (NRR) over the past two decades. The NRR measures the extent to which one generation is replaced by the next. A rate of 1.0 indicates that one generation is exactly replaced by the next generation. A rate less than 1.0 indicates that one generation is not being replaced by the next generation. The Bahamas has been below 1.0 during the past decade indicating that the population is not reproducing itself naturally.
- (3) **Low Assumption (C)** - It was assumed that there would be mitigating increases in the total fertility rate resulting in the total fertility rate not reaching replacement level during the projection period. The fact that women are becoming more educated increases their chances of employment resulting in reduced fertility among women. The enactment of Family Planning by the Government will also have a negative impact on fertility among women. Further, Government has also embarked upon stringent immigration policies of undocumented immigrants who are usually from countries with high fertility.

MORTALITY

Two assumptions were made concerning mortality:-

- (1) **High Assumption (A)** - Observed mortality during the decade 2000-2010 increased 15.4% from that of the previous decade. Although there have been substantial improvements in health and the overall standard of living, these improvements have been overshadowed by a substantive increase in externally caused deaths mainly accidents, suicide and homicide coupled with deaths due to lifestyle diseases. It was therefore assumed that trends in mortality will show no significant changes in the near future. As a result, minimal increase in life expectancy was projected over the projection period

- (2) **Medium Assumption (B)** – Observed mortality was assumed to be the same as in the high assumption however, life expectancy was projected to increase gradually over the projection period as preventive measures in the form of the Chronic Non-Communicable Diseases Programme and Healthy Life Style Initiatives are presently being implemented by the government and should have a positive effect on influencing life expectancy.

MIGRATION

Net migration as a contributor to total population growth tripled in 2010. Almost a quarter (24.5%) of the population growth in 2010 was due to migration. This increase is significant due to the fact that net migration as a contributor to population growth was on the decline beginning with the 1980's, when it had fallen to 10.3% and then showing a negative outflow of -8.0% in the 1990's. However, by the turn of the century, net migration started to show an increase again representing 8.1% of the total population growth in 2000.

The migration assumptions are all primarily based on the following underlying factors, though their effects on the assumptions are varied:-

- (i) The Government's Immigration Policy
- (ii) The Government's continued mass repatriation exercise
- (iii) The Government's continued efforts to enforce the Bahamianization Policy
- (iv) New immigrants (mostly Haitians).
- (v) Re-Entry of immigrants (mostly Haitians) that were previously repatriated
- (vi) The increasing number of migrants from other countries (e.g. China, Cuba, The Philippines, etc.) seeking job opportunities, thereby offsetting the Government's efforts.

- (1) High Assumption (A)** - Net migration would remain constant at 400 persons per annum throughout the projection period

(2) Medium Assumption (B) - Net migration will remain constant at 400 to the year 2020 then decline to 300 to the year 2030, thereafter remaining constant at 200 for remainder of the projection period.

(3) Low Assumption (C) Net migration will remain constant at 200 until the year 2030 and thereafter, there will be 0 migration to the end of the projection period. In addition to factors one and two above, this assumption takes into consideration the fact that within recent years, an increasing number of Bahamians who studied abroad have opted to remain with their host country for employment purposes.

The mortality assumption outlined above apply to both All Bahamas and New Providence, however, for fertility and migration, the rates for New Providence differ from those for All Bahamas.

NEW PROVIDENCE

Fertility New Providence rates were slightly higher than those for All Bahamas, and were projected independently of All Bahamas. The assumptions were basically the same however; there were no projected rates of decline for New Providence. Although there were no projected rates of decline, New Providence is also going through a transitional period of declining net reproduction rates (NRR) as is being experienced by All Bahamas.

Three assumptions were made concerning fertility:-

- (1) High Assumption (A)** - It was assumed that the total fertility rate of 2.0 per woman in the base year, will increase to 2.39 by the year 2015 and remain constant until the year 2040.
- (2) Medium Assumption (B)** - It was assumed that the total fertility rate of 2.0 per woman will increase to 2.10 in 2015 and remain constant thereafter.

- (3) **Low Assumption (C)** - It was assumed that there would be mitigating increases in the total fertility rate from 2.0 in the base year to 2.02 at the end of the projection period, resulting in the total fertility rate not reaching replacement level during the period.

Migration Migration patterns for New Providence were calculated separately using 2010 Census data for New Providence only. Consideration was given to the government's new immigration policy, anchor projects in the Family Islands and also internal migration and its effects on overall net migration rates for New Providence. The results were lower migration rates for New Providence than for All Bahamas. However, the pattern of decline was the same as All Bahamas.

The underlying factors influencing the assumptions for New Providence are basically the same as All Bahamas except for the government's Family Island Anchor Projects that was not factored into the All Bahamas Assumptions, this initiative by the government was designed to provide economic opportunities for residents in their host island/s thereby reducing the outward flow of migrants into the island of New Providence:-

- (1) **High Assumption (A)** - Net migration would remain constant at 300 persons per annum throughout the projection period.
- (2) **Medium Assumption (B)** - Net migration will remain constant at 300 to the year 2020 then decline to 200, remaining constant thereafter.
- (3) **Low Assumption (C)** Net migration will remain constant at 200 until the year 2030 and thereafter, there will be 0 migration to the end of the projection period.

Projection Highlights (All Variants)

High Variant

According to this variant the population of The Bahamas is projected to increase from 351,500 in 2010 to 475,260 in 2040, resulting in an increase of 35.2% and an average annual growth rate of 1.2% for the thirty year period. The population under 15 years of age will decrease in proportion, falling from 26.8% in 2010 to 22.2% in 2040. The percentage of 15-64 year olds will decrease from 67.1 in 2010 to 64.2 in 2040, resulting in an increase in the population 65 years and over from 6.16 in 2010 to 13.7 in 2040.

Medium Variant

Under this variant, the ‘most probable variant’, the population of The Bahamas is expected to grow at an average annual rate of 0.97% reaching a total population count of 454,060 by 2040. The pattern of age distribution will follow that of the high variant where the proportions of persons under 15 years will decrease (reaching 20.7% by 2040), similarly the proportion of 15-64 year olds will decrease to 64.8% in 2040. The elderly population will triple by 2040, from 21,600 in 2010 to 65,850 in 2040.

Low Variant

The low variant predicts that the population will grow by 23.2% (or an average annual growth rate of 0.77%) resulting in a total population of 433,130 by the year 2040. Again the pattern of age distribution does not change significantly from the other two variants. The proportion of the population under age 15 years will again decrease while the proportion aged 15-64 years will increase. The proportion of elderly 65 years and over will show no significant change from the elderly of the high and medium variants.

Analysis of the Projections (Medium Variant)

The Medium Variant has been considered to be the set of assumptions that is likely to yield the most probable population outcomes.

According to the medium variant The Bahamas will see a 29.2% increase in its population by the year 2040, resulting in a total of 454,000 persons. During the period 2000-2010, the significant contribution of migration to population growth was seen in the form of an inflow of some 11,714 immigrants. This increase in immigrants will have a positive influence on population growth as seen in **Table i below**, there will be a steady flow of immigrants until the year 2020, and thereafter the numbers will start to decline. The crude birth rate will continue to increase to the year 2025 and is projected to decline to 13.3 in 2040. With respect to the crude death rate **Table i shows** that the rate remains stable until 2015, thereafter, increasing to a rate of 9.1 in 2030. The changes in these components have resulted in an average annual growth rate of 0.97% for the 30 year period.

Age Distribution

Table ii shows the projected distribution of the population by age-group and **Figure 1** shows the percentage distribution. During the period 2000-2010 the proportion of the population under 15 years declined 2.6 percentage points. There was a 5% increase in the total population 5-14 years. However, the proportion of the population 5-14 years is projected to decline from 18% in 2010 to 14% by the end of the projection period. The population of working age 15-64 years is also projected to decline over the thirty year period, moving from 67.1% of the total population in 2010 to 64.8% in 2040. The population 65 years and over is projected to increase from 6.2% of the total population in 2010 to 14.5% in 2040, resulting in an 8.3 percentage point increase over the thirty year period.

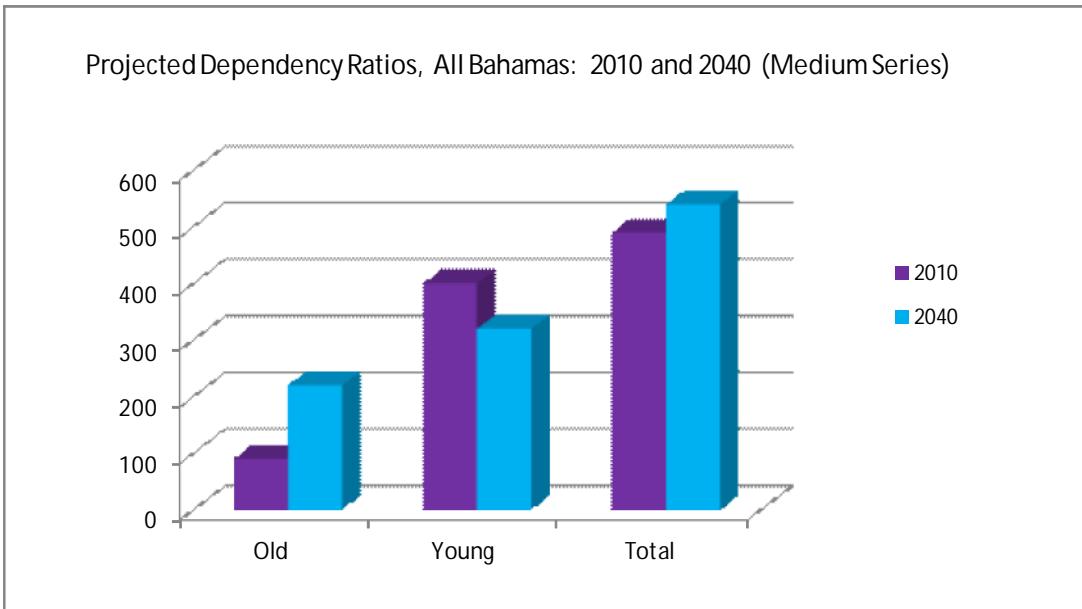

Figure 1

Dependency Ratio

The dependency ratio is the rate at which persons under 15 years of age, and 65 years or older depend on the population of working age 15-64 years. According to the projections the dependency ratio will increase marginally from a ratio of 490 in 2010 to 540 in 2040. However, the proportion of elderly persons in the population is expected to increase substantially over the 30 year projection period from 21,600 persons representing 6.2% of the population in 2010 to 65,850 representing 14.5% of the population in 2040. Although, the total dependency ratio and the old age-dependency ratios are projected to increase throughout the projection period, the young-dependency ratio will show a decline, from 400 in 2010 to 320 in 2040 (**Figure 2**).

Figure 2

Changing Age Structure

An important characteristic of the age structure of a population is the proportion of women in the childbearing age (15-49). Although, the projections indicate that the proportion of women of childbearing years (15-49) will gradually decline from 54.5% in 2010 to 46.5% in 2040 the overall number of women in the childbearing ages will increase from 98,800 in 2010 to 108,190 in 2040, representing a 9.5% increase over the thirty year period. Large numbers of births will continue throughout the projection period even though fertility is projected to reach 2.01 in 2020 all the way through to 2030 and thereafter, remain constant at 2.0 to the end of the projected period.

The overall sex ratio in 2010 was 93.9. However, by the year 2040, the sex ratio will increase to 95.2. The median age was 29 years in 2010 and is projected to increase to 32 years by the year 2020 (**Table iii**), thereafter, progressively increasing to a median age of 37 years by 2040.

However, despite the large number of births that will occur, the proportion of persons under the age of 30 years will continue to decrease, while the proportion aged 30 years or older will steadily increase as seen in Table iv. These projected demographic changes have far reaching implications for the care and provision of adequate social services for both the young and the elderly.

GLOSSARY OF TERMS

Appendix II

GLOSSARY OF TERMS

Age-Specific Fertility rate (ASFR)	The number of births in a year for a population of a given age and sex to the midyear population of that same sex and age group.
Annual Growth Rate (GR)	The rate at which the population is increasing or decreasing in a given year due to natural increase and net migration, expressed as a percentage of the base population.
Births	The total number of annual births
Child-Woman Ratio	The number of children under the age of five per woman of childbearing age (15-49 yrs).
Coale Demeny Model Life Tables	Families of life tables derived from empirical life tables of Europe and other industrialized nations of the world. They are based primarily on data from the first half of the 20 th century.
Cohort Component Projection.	A projection made by subjecting all cohorts, on an annual or five year basis, to mortality and migration assumptions, and applying fertility assumptions to women of reproductive age.
Crude Birth Rate (CBR)	The number of live births per 1,000 population in a given year.
Crude Death Rate (CDR)	The number of deaths per 1,000 population in a given year.
Deaths	The total number of annual deaths
Dependency Ratio	The ratio of the economically dependent part of the population (those aged 0-14 and 65 and over) to the productive part (those aged 15-64).
Doubling Time	The number of years it would take for the population to double its current size at the current annual rate of growth.

Appendix II

GLOSSARY OF TERMS CONT'D

Gross Reproduction Rate (GRR)	The average number of daughters that would be born to a woman (or a group of women) during her lifetime if she passed through all her childbearing years conforming to the age-specific fertility rates of a given year. This is similar to the TFR except that it counts only daughters.
Infant Mortality Rate (IMR)	The number of deaths to infants under one year of age per 1,000 live births.
Initial Age Distribution	The age sex distribution at the beginning of a projection period.
Interpolation	Given two numbers that serve as boundary points, it is possible to estimate the values that lie at intervals between the two points. For example, if the total fertility rate for a country or region was actually measured only in 1980 and in 1995, by assuming even increments from year to year, it is possible to interpolate a TFR for each intervening year. (Spectrum uses a linear form of interpolation so that the difference between each annual value is the same. Other nonlinear forms of interpolation also are possible, but are not used in Spectrum.)
Life Expectancy ($e(0)$)	The average number of years a newborn can expect to live based on the mortality conditions at the time.
Mean age of Childbearing	The average age of mothers at the time of birth.
Median Age	The age that divides a population into two numerically equal groups.
Net Migration	The number of people who move to an area minus those who move away
Net Reproduction Rate (NRR).	The average number of daughters that would be born to a woman (or a group of women) during her lifetime if she passed through all her childbearing years conforming to the age specific fertility rates and age specific mortality rates of a given year. This is similar to the GRR except that it includes the effect of mortality that would cause some women to die before completing their childbearing years.

Appendix II

GLOSSARY OF TERMS CONT'D

Population aged 0-4	The portion of the population under age five. It is often of interest as it may be subject to high mortality, and consequently may require a large amount of health care relative to other age groups.
Population aged 5-14	The portion of the population which is generally considered to be of school age.
Population aged 15-64	The portion of the population which is generally considered to be of employment age
Population aged 65+	The portion of the population which is generally considered to be of post-employment age.
Population Projection	Computations depicting the future course of a population's size, its structure, and its interaction with dynamics such as fertility, mortality, and migration. The projection is constructed based on assumptions about the future course of those population dynamics.
Population Pyramid	A graphic that portrays an age sex distribution. It is so named because of its shape.
Quinquennial	Five Year Age Groups. The basis for most cohort component projections is five year age groups over five year intervals.
Rate Of Natural Increase (RNI)	The rate at which the population is increasing or decreasing in a given year due to the surplus or deficit of births over deaths, expressed as a percentage of the base population.
Sex Ratio	The number of males per 100 females in a population.
Total Fertility Rate (TFR)	The average number of children that would be born alive to a woman (or a group of women) during her lifetime if she were to pass through all her childbearing years conforming to the age specific fertility rates of a given year.
Under Five Mortality Rate (U5MR)	The number of deaths to children under the age of five per 1,000 live births.

Appendix III

ACRONYMS

ASFR	Age Specific Fertility Rate
CBR	Crude Birth Rate
CDR	Crude Death Rate
e(0)	Life Expectancy
GR	Annual Growth Rate
GRR	Gross Reproduction Rate
IMR	Infant Mortality Rate
NRR	Net Reproduction Rate
RNI	Rate of Natural Increase
TFR	Total Fertility Rate
U5MR	Under Five Mortality Rate
USAID	United States Agency for International Development
