Bahamas (Site) STEPS Survey 2012

## Fact Sheet

The STEPS survey of chronic disease risk factors in The Bahamas was carried out from June 2011 to March 2012. The Bahamas carried out Step 1, Step 2 and Step 3. Socio demographic and behavioural information was collected in Step 1. Physical measurements such as height, weight and blood pressure were collected in Step 2. Biochemical measurements were collected to assess blood glucose and cholesterol levels in Step 3. The STEPS survey in The Bahamas was a population-based survey of adults aged 25-64. A stratified multi-stage cluster sample design was used to produce representative data for that age range in The Bahamas. A total of 1,654 adults participated in The Bahamas STEPS survey. The overall response rate was $54.1 \%$. A repeat survey is planned for a future date if funds permit.
